1 Overview

JEFRi binding provides a mechanism to bring rich data visualization and editing to JEFRi contexts. When using JEFRi binding, developers will be able to choose from a rich set of UI components to display entities and gather feedback from users with a minimal amount of configuration. JEFRi data-bound contexts will (depending on the entity's attributes and available controls) have full round-trip data capabilities, from loading data, gathering edits, and sending data to the JEFRi persistence store.

Input (get data) DatePicker "Combo" box sliders, spinners Input RichText Check/Radiobox groups

Ouput (layout data) Tables, lists, trees Panels Dialog Tabs Accordians

Workflows Form Wizard Properties Panel Detail
