JEFRi Integrated Query

April 8, 2012

Contents

JEFRi Core uses a bare skeleton object to specify data to return from queries. While this is a concise and powerful mechanism, it does not provide the natural language approach to data querying that SQL and the like embrace. JEFRi Integrated Query aims to provide a set of natural-language calls to query data sources. While the underlying implementation will be against JEFRi contexts, the API is easily repurposed to target SQL databases, plain arrays, or any other data source.
